# Abstract

- ▷ Realize a system for integrating data about football players coming from heterogeneous sources.
- ▷ Complete Information Integration workflow: GAV mapping with materialization and virtualization approaches for query answering.

1.

# THE DATA

Soccer Players Performances

# Source Datasets

## FBref

It contains statistics about real soccer player performances for the Big 5 European leagues, for seasons from 2012/2013 to 2021/2022.

Data comes from [FBref.com](https://fbref.com), famous international Web portal devoted to tracking statistics for football teams and players from around the world.

## FM20

It contains fictional player attributes contained in the database of Football Manager 2020 (season 2019/20) videogame.

Football Manager simulation gaming has become particularly interesting also in real soccer scouting activities for its realistic recreation of professional world of football.

<https://www.footballmanager.com/features/data-hub>

The source datasets come from two distinct kaggle repositories.

They both deals with data about football players, but from two completely different perspectives.

Datasets are heterogeneous in schema and semantics, but not in data format, which is in both cases CSV.

# 13 CSV files

12 for FBref dataset + 1 for FM dataset

# 346,797 records

202,047 for FBref dataset + 144,750 for FM dataset

# 395 attributes

332 for FBref dataset + 63 for FM dataset

*Is there a sort of relationship  
between hypothetical player  
attributes and actual performance  
on the field?*

2.

# IIS Formal Definition

# Source Schema

Defense <sub>/31</sub>	Contains FBref data on a player's defensive performance.
GCA <sub>/24</sub>	Contains FBref data on a player's goal and shot creation.
Info <sub>/13</sub>	Contains FBref general information about a player.
Keeper <sub>/26</sub>	Contains FBref data on goalkeeper performance.
KeeperAdv <sub>/33</sub>	Contains FBref advanced data for goalkeeper performance.
Misc <sub>/24</sub>	Contains FBref miscellaneous player performance data.
Passing <sub>/30</sub>	Contains FBref passing data.
PassingTypes <sub>/33</sub>	Contains FBref data about players' pass types.
PlayingTime <sub>/29</sub>	Contains FBref data about a player's playing time.
Possession <sub>/32</sub>	Contains FBref possession data.
Shooting <sub>/25</sub>	Contains FBref data about a player's shooting performance.
Standard <sub>/32</sub>	Contains an overview of FBref player performance data.
FM20 <sub>/64</sub>	Contains Football Manager 2020 videogame fictional player attributes.

# Global Schema

Player <sub>/13</sub>	Contains general information about the players.
DefenseStat <sub>/18</sub>	Contains data on a player's defensive performance focusing on most relevant statistics.
GoalkeeperStat <sub>/10</sub>	Contains data on goalkeeper performance focusing on most relevant statistics.
GoalStat <sub>/18</sub>	Contains data on a player's attacking performance in relation to his ability to score and/or to create opportunities.
PassingStat <sub>/18</sub>	Contains passing data focusing on most relevant statistics.
PlaymakingStat <sub>/20</sub>	Contains data on a player's performance in relation to his ability to playmake: creating opportunities for the team mates, being at the center of the action.
PresenceStat <sub>/16</sub>	Contains data on a player's presence on the field and the corresponding results of his team.
GoalkeeperAbility <sub>/5</sub>	Contains fictional player attributes relative to goalkeeper.
MentalAbility <sub>/10</sub>	Contains fictional player attributes relative to mental abilities.
PhysicalAbility <sub>/8</sub>	Contains fictional player attributes relative to physical abilities.
TechnicalAbility <sub>/14</sub>	Contains fictional player attributes relative to technical abilities.

# IIS Implementation

Data Integration Main Process

# Technological Stack

## Apache Spark™

Multi-language engine for executing data engineering, data science, and machine learning on single-node machines or clusters.

## Slick

Modern database query and access library for Scala. It features an extensible query compiler which can generate code for different backends.

## ElephantSQL

Automates every part of setup and running of PostgreSQL clusters. Available on all major cloud and application platforms all over the world.

# Workflow

Load and query the pre-processed data with **Apache Spark**.

Define the Global Schema through **Slick**.

Materialize the Integration result on an **ElaphantSQL** remote instance.
